

# Excitons, Raman spectroscopy

---

# Frenkel Excitons

---

A Frenkel exciton is localized on an atom or molecule in a crystal.

The band gap of solid krypton is 11.7 eV. Lowest atomic transition in the solid is 10.17 eV.

Excitons transport energy but not charge. Frenkel excitons are occur in organic solar cells, organic light emitting diodes, and photosynthesis.

# OLEDs

---

Aluminum cathode
Electron transport layer
Emission layer
Hole transport layer
ITO anode
Glass

Cathode is typically a low work function material Al, Ca - injects electrons

Anode is typically a high work function material ITO - injects holes

# OLEDs

---

Galaxy Tab

# Organic solar cells

Excitons in polymers: a monomer is in an excited states and this moves down the chain.

# Perovskite solar cells

Efficiency  $\sim 22\%$

# Raman Spectroscopy

C. V. Raman

Inelastic light scattering

$$\omega = \omega' \pm \Omega$$

$$\vec{k} = \vec{k}' \pm \vec{K} \pm \vec{G}$$

Phonons, magnons, plasmons, polaritons, excitons

$$\vec{K} \approx 0$$

# Raman Spectroscopy

$$\chi = \chi_0 + \frac{\partial \chi}{\partial X} X \cos(\Omega t)$$

$$\vec{P} = \varepsilon_0 \chi \vec{E} \cos(\omega t) + \varepsilon_0 \frac{\partial \chi}{\partial X} X \cos(\Omega t) \vec{E} \cos(\omega t)$$

There are components of the polarization that oscillate at  $\omega \pm \Omega$ .

# Raman Spectroscopy

Stokes:

$$I(\omega - \Omega) \propto n_k + 1$$

anti-Stokes:

$$I(\omega + \Omega) \propto n_k$$

## Vacancy-hydrogen defects in silicon studied by Raman spectroscopy

E. V. Lavrov\* and J. Weber
